The true left end of clone C25G4 is at 32680 in this sequence. The true right end of clone F28D1 is at 725 in this sequence. The start of this sequence (1. .103) overlaps with the end of sequence Z70684 The end of this sequence (32680. .32784) overlaps with the start of
                                                                overlapping sections once, or longer becoverlap between neighbouring submissions Location.Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is not the entire insert of clone F08G5. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (06-APR-1996) Nematode Sequencing Project, Sanger Institute, Hinxton, Cambridge CB10 18A, England and Department of Genetics, Washington University, St. Louis, MO 63110, USA. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                 Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, pADM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coli, enable the cloning of certain genes of Ketogulonigenium in E.coli as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the replicon of Ketogulonigenium endogenous plasmid pADM291.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptides with vector

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ
                      The present invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, paDM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coli, enable the cloning of certain genes of Ketogulonigenium in E.coli as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the
                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid vector comprising Ketogulonigenium replicon found a specific deposited endogenous plasmid, useful for producing polypeptides and/or transcripts by culturing host cells transformed with vector -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1981

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAS18309 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        12-MAR-2002
                                                                                                                                                                                                      The present invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, pADM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coll, enable the cloning of certain genes of ambification of vector DNA. The present DNA sequence represents the amplification of vector DNA. The present DNA sequence represents the region of Ketogulonigenium endogenous plasmid pADM291 that supports plasmid vector replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        05-APR-2000; 2000US-194625P

The Ketogulonigenium plasmid endogenous to strain NRRL B-30035. The polynucleotide can be used in a vector. The vector comprises either (1) the polynucleotide and a marker gene or (ii) the polynucleotide, a promoter, a transcription terminator and a discrete series of restriction endonuclease recognition sites between the promoter and transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid comprising the designated pADM291 is endogenous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              05-APR-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
           The invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, pADM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coli, enable the cloning of certain genes of Ketogulonigenium in E.coli as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the Ketogulonigenium endogenous plasmid pADM291.
                                                                                                                                                                                 Novel nucleic acid vector comprising Ketogulonigenium a specific deposited endogenous plasmid, useful for pr polypeptides and/or transcripts by culturing host cell with vector -

                                                                                                                                                                                                                                          Ş
                                                                                                                                                                                                                                                                        В
                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

AAS64197 AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed at the print
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-MAR-2002
                                                                                                                                                                                                                                                                                The present invention provides a number of human immune system associate genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC organisms comprise a polynucleotide encoding a growth hormone fragment CC capable of stimulating the activity of hormone-sensitive lipase (the key CC enzyme in lipolysis) and inhibiting acetyl CoA carboxylase (the key CC enzyme in lipolysis) and inhibiting acetyl CoA carboxylase (the key CC enzyme in lipolysis). The growth hormone fragment preferably contains CC at least the disulphide-bonded loop of a mammalian growth hormone (but is CC not the full-length growth hormone) and is optionally linked to an CC epitope tag or heterologous fusion protein partner. The transgenic CC organism may be a microorganism used to produce a fermented product CC (e.g., yeast), or an edible plant or animal or cell thereof. Food or CC drink made using methods of the invention are used to modify fatylean CC ratio, lipid metabolism or food use in a mammal. In particular, the food CC or drink products may be used to treat or prevent obesity, particularly CC in humans, and may also be used to improve the fatylean ration of the CC invention, the human growth hormone (hdf) fragment analogue AOD9604 was CC expressed in yeast, optionally fused to the FLAG epitope (AAB73625). CC The present sequence is described as a DNA sequence from yeast in CC expressed in the sequence listing, but is not further referred to in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                        diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                          (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving

                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a new bacterium of genus Ketogulonigenium. Ketogulonigenium may further comprise a transgene, comprising a DNA sequence from an endogenous ketogulonigenium plasmid. Methods for transforming Ketogulonigenium are also described. The invention is useful for producing 2-keto-L-gulonic acid (2-KLG) from L-sorbose or sorbitol. The present sequence represents the nucleotide sequence of replicon #1 on the Ketogulonigenium endogenous plasmid pADDMX6L1. Note: The present sequence for SEQ ID No 5 given in Fig 5 is different that given for SEQ ID No 5 in the sequence listing (AAS17226).
